

### Outgassing comparison according to ASTM-E-595 (CVCM)\*

\* Tests performed by an independent testing company.

Definition of CVCM: Collected volatile condensable material – the quantity of outgassed matter from a test specimen that condenses on a collector maintained at a specific constant temperature for a specified time. CVCM is expressed as a percentage of the initial specimen mass and is calculated from the condensate mass determined from the difference in mass of the collector plate before and after the test.
